TABLE II.—Population and number of active non-Federal physicians in 1940, and estimates of possible physician use in 1960, for the several health service regions outlined in each State..... pages 88–89

A C K N O W L E D G M E N T

The authors are indebted to Donald G. Anderson, M. D., Secretary of the Council on Medical Education and Hospitals, and Frank G. Dickinson, Ph. D., Director of the Bureau of Medical Economic Research, American Medical Association, for their services in reviewing earlier drafts of this paper and for their many valuable criticisms and suggestions.

The authors are, of course, responsible for the various working hypotheses, statistical procedures, and results presented in the bulletin.

Introduction

During recent years, there has been much discussion of the need for additional physicians by governmental agencies and for civilian practice in many parts of the country. While localized shortages are recognized by all students of the subject, many contend that the over-all supply is adequate, or nearly so, and that it is the distribution of physicians which is at fault. Already some States and communities have felt impelled to take public measures to augment the supply of physicians, especially in rural areas. Because of this rather confused picture, it seemed advisable to examine such data as were available in the hope of throwing some light on the general situation.

Within the past few years, the authors have studied the distribution of hospitals and the adequacy of available beds. Out of those studies there evolved a concept of health service areas and a scheme of hospital coordination wherein such institutions could be related to each other from the standpoints of location, bed capacity, and staff organization.

Following passage in 1946 of the National Hospital Survey and Construction Act, each State hospital authority formulated its own plan of hospital distribution. While differing in detail from that presented by the authors in Public Health Bulletin 292 (1), regionalization characterized all of these plans, and other essential features were not dissimilar. Inasmuch as the hospital is coming more and more to be the focal point of medical practice, it was decided that the health service areas outlined in the course of our hospital studies might also be used in studying physician utilization.

The central purposes of this, the second monograph of the series, are to describe the existing distribution picture for

physicians against such a pattern of medical service areas, to present estimates of the number of physicians that might be utilized as health services are extended more uniformly throughout the Nation, and to forecast possible physician resources.

Lack of current local data for physicians and population led the authors to select the year 1940 as a base for describing existing conditions. That is the latest year for which complete census data are available. Furthermore, the 1940 American Medical Directory is the most recent source of county physician totals which are not influenced by dislocations resulting from war mobilization.

For this base year, comparative data are presented to show the uneven distribution of physicians which has grown up over the years, and the extent of differences among areas. Projections are made to indicate possible training goals on the basis of data available concerning numbers of physicians who may be expected to enter the profession, anticipated losses through death, and the numbers of physicians who might be needed if selected measures of physician use in 1940 apply in future years.

Figures given in this paper should not be construed as recommendations. The analyses presented are intended to illustrate methods that could be followed in the preparation of physician estimates for some future date, if different assumptions are made, and to indicate possible location patterns for physicians. The authors fully recognize that many forces which now limit the effective demand for physicians in some areas must be removed or substantially mitigated before there will be any material tendency for the distribution of physicians to parallel more nearly that of population.

Trends in Physician Totals

Physician totals published in the American Medical Directories indicate that, except for a few years in the early 1920's there has been a gradual expansion in the number of physicians in the continental United States since the turn of the century. From a total of 134,000 in 1909, the number had increased to nearly 148,000 in 1918. The physician count which changed but slightly during the following decade was somewhat over 152,000 by 1929 and then expanded to a total which in 1940 exceeded 175,000. Preliminary data for 1949 indicate that there are now more than

200,000 physicians in the continental United States.¹ Over the period, however, the increase did not consistently keep pace with population changes. Actually the average number of physicians per unit of population declined steadily from 149 per 100,000 persons in 1909 to 125 per 100,000 in 1929. After 1929, the ratio gradually rose to 133 per 100,000 by 1940 and to 137 by 1949. (See table 1.)

Data indicating the number of physicians who limited

¹The 1949 total is a preliminary estimate made available to the authors by officials of the Directory Department of the American Medical Association.

their practice to a specialty are available only for certain years from 1923 to 1949.² The trend in specialization which prevailed during the past quarter of a century is revealed in a general way by comparison of data assembled by the Commission on Graduate Medical Education (2) and by Leland (3) with material tabulated from the 1940 American Medical Directory (4). In 1923, for example, only 15,408

¹ Physician totals presented for years from 1909 to 1942 are those published by the American Medical Association on the basis of directory counts. The 1948 total is a preliminary estimate published in the Journal of the American Medical Association, Aug. 21, 1948. The 1949 total is a preliminary estimate made available to the authors by officials of the Directory Department of the American Medical Association.

² Specialist totals for 1923, 1929, 1934, and 1938 are those published in a report of the Commission on Graduate Medical Education (2). The total for 1931 appeared in a report by Leland (3). The 1940 total was obtained by tabulating data for individual physicians listed in the 1940 American Medical Directory (4). The totals for 1948 and 1949 are preliminary estimates made available to the authors by officials of the Directory Department of the American Medical Association.

³ Data are not available.

physicians reported that they were confining their practice to a specialty; by 1931, 24,826 were in that category; and in 1940, 36,880 physicians. By 1949, it was estimated that 50,000 were so limiting their practice—more than triple the number at the beginning of this period. This steady increase is reflected in the proportion of specialists relative to all physicians which more than doubled during the 25-year period. (See table 1.)

Totals for the Nation conceal the uneven distribution of physicians among the several States. That these inequalities had become more pronounced in the past 25 years is evident from data in figure 1. To facilitate comparisons, the States were grouped into six geographic areas³ and the average physician-population ratio for each area was computed for selected years in the past quarter of a century. In 1923, the Pacific States, at one extreme, maintained as many as 160 physicians per 100,000 persons while there were only 116 and 117 physicians, respectively, for comparable groups of residents in the South Atlantic States and South Central States. This wide disparity in numbers of available physicians continued over the years. In 1931, the greatest number of physicians in any area of the United States, 159 per 100,000 population, was still to be found in the Pacific States while in the South Central States there were but 102 physicians per 100,000 population. By 1940, the distribution had so changed that in the New England and Middle Atlantic States there were 168 physicians for a unit of 100,000 persons, the Pacific States continued to maintain a high physician ratio of 158 per 100,000 persons while the South Central States had but 95 physicians for a comparable population group. Preliminary figures for 1948 indicate that the New England and Middle Atlantic States now have the highest physician ratio of any area in the last 25 years, 174 per 100,000 population, while the ratio of the South Central States is 99 for a similar population group.

Community Hospital Development in Relation to Physician Location

In previous papers, (5), (6), (7), (8), (9), the authors have reported on the factors which seem to influence the location and movement of physicians. Physicians are attracted to broad areas of relatively high per capita

income, and within these areas, to centers of population that are generously supplied with hospital facilities. It would seem from these studies that hospital facilities, even apart from the per capita income of the locality, served both to attract and to retain physicians.

Passage of the Hospital Survey and Construction Act (10) not only emphasized the importance of advanced thinking relative to future trends in hospital placement but also

² Specialty classification, as used in this study, is based upon type of practice indicated by symbols opposite the physician's name in the American Medical Directories. The 1940 Directory states:

"A symbol designating specialty practice is entered on request whenever the physician is (1) a member of a constituent State association, (2) a member of a special national or interstate society, the membership of which is listed in the directory, or (3) a professor, an associate or assistant professor in an approved medical school. * * *

"When the abbreviation designating a specialty is followed by a star (*) it indicates that the physician claims his practice is limited to that particular branch of medicine; * * *. This information concerning specialty practice is based only on personal data furnished by the physician."

The Commission on Graduate Medical Education (2) defines a specialist as "the man who claims to limit his work to his specialty, as shown by his listing in the American Medical Association Directory."

This classification should not be confused with specialty board certifications.

³ The six geographic areas were composed by grouping the States as follows: **New England and Middle Atlantic:** Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, and Pennsylvania. **South Atlantic:** Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, and Florida. **North Central:** Michigan, Wisconsin, Ohio, Indiana, Illinois, Minnesota, North Dakota, South Dakota, Iowa, Nebraska, Missouri, and Kansas. **South Central:** Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Oklahoma, Louisiana, and Texas. **Mountain:** Montana, Idaho, Wyoming, Colorado, Utah, Nevada, New Mexico, and Arizona. **Pacific:** Washington, Oregon, and California.

NUMBER OF PHYSICIANS PER 100,000 POPULATION

FIGURE 1.—Number of physicians per 100,000 population in designated geographic areas of the United States for specified years.

accentuated the need for personnel in sufficient numbers and in proper location to assure economical and efficient provision of medical services. Since the geographic distribution and functional relationship of hospitals and health centers outlined in our earlier report (1) are employed also for examining physician utilization and location, a brief description of the basic pattern together with underlying considerations is repeated.

Areas designated as health service districts would constitute the geographic and population units for hospital development. They were tentatively outlined so as to contain a locality with relatively adequate hospital facilities which might serve as an integrating center for tying hospital and health activities of city, town, and rural communities into a coordinated scheme for service. Each district consisted generally of a nucleus county with its hospital center surrounded by several adjacent counties whose hospital facilities were less advanced.⁴ The several districts which fell into a more or less broad trade area⁵ were considered a region and the most suitable hospital center therein was designated as the nucleus for the entire region.

It is recognized that medical services follow a variety of patterns, depending largely on the location of existing hospitals and the type of medical practice under consideration. The general practitioner who usually makes the initial contact with a patient serves an area which is, for the most part, within a radius of a few miles from his home or office. A much wider area is served by physicians who limit their practice to a specialty since their patients are generally referred by other physicians. The activities of a specialist engaged in a highly restricted field may not be limited to any particular locality. He would generally be located in an urban area well supplied with hospital beds; patients might be referred not only from distant locations within the same broad region, but from other States and even foreign countries. Neither now nor in the immediate

future are patterns of service for individual physicians likely to conform to areas outlined by definite political boundaries.⁶ On the other hand, such units represent divisions for which many statistics pertaining to population, economic resources, hospital facilities, and professional personnel are available. As a matter of fact, these political units must be taken into account if local and State governments are to participate financially or administratively in implementing health service programs. We have, therefore, used the districts and broad hospital service regions outlined in figure 2 as the basis for computations presented in this report.

In the background is the concept that hospital or related facilities of some type should be available to every physician. For rural areas these facilities might consist of a small hospital or health center within the immediate locality but functionally tied to hospital centers at secondary and primary area levels. With suitable fiscal provisions, there would be a flow of patients or professional services between areas, depending on skills required and available technical resources. In this way, physicians in all locations would have access, directly or indirectly, to the physical facilities of a complete hospital system. They could also enjoy the advantages of consultations with other physicians, particularly specialists, either through arrangements for meeting at the local hospital or through contacts with experts located at hospital centers.

The foregoing projected scheme has been modified in considerable detail by the several States in the plans they have submitted under the Federal Hospital Survey and Construction Act; all of them, however, present some scheme of integration on a regional basis. In the interest of uniformity and for purposes of our discussions, it seemed best to follow the original plan as presented in Bulletin 292 rather than adapt our methods to a variety of State plans many of which, also, have little more than theoretical basis at this time.

Physician Resources in Tentative Hospital Service Districts in 1940

Totals presented in this report of physicians available in 1940 for local services represent counts obtained from the 1940 American Medical Directory after physicians designated as being employed by Federal agencies and as "retired" or "not in practice" had been deleted. This group, hereinafter referred to as "active non-Federal," in-

cludes 160,480 of the 175,146⁷ total listed in the Directory. "Retired" and "not in practice" physicians constituted nearly 6 percent of the United States total in 1940, and Federal physicians less than 3 percent. The percentage of the total so affected varied somewhat from one geographic area to another. Approximately 5 percent of the physicians in the New England and Middle Atlantic, the North Central and the South Central groups of States were classified as

⁴ Centers selected for primary districts contained a minimum of 250 general and allied special hospital beds, those for secondary districts, 100 beds, and those for proposed-secondary districts, 50 beds. Some counties neither contained as many as 50 beds in any one locality nor touched a county which could so qualify. One such county occurring alone was included in the nearest primary, secondary, or proposed-secondary district, but when two or more were adjacent, they were classified as an isolated district.

⁵ The outlines of these areas were determined roughly after reviewing various commercial trade area maps (11) which portrayed retail trade practices.

⁶ See for example, Dickinson: A medical service area map of the United States (12).

⁷ This figure was obtained by tabulating data for individual physicians listed in the 1940 American Medical Directory. It differs from the 1940 total published in the Directory by 236.

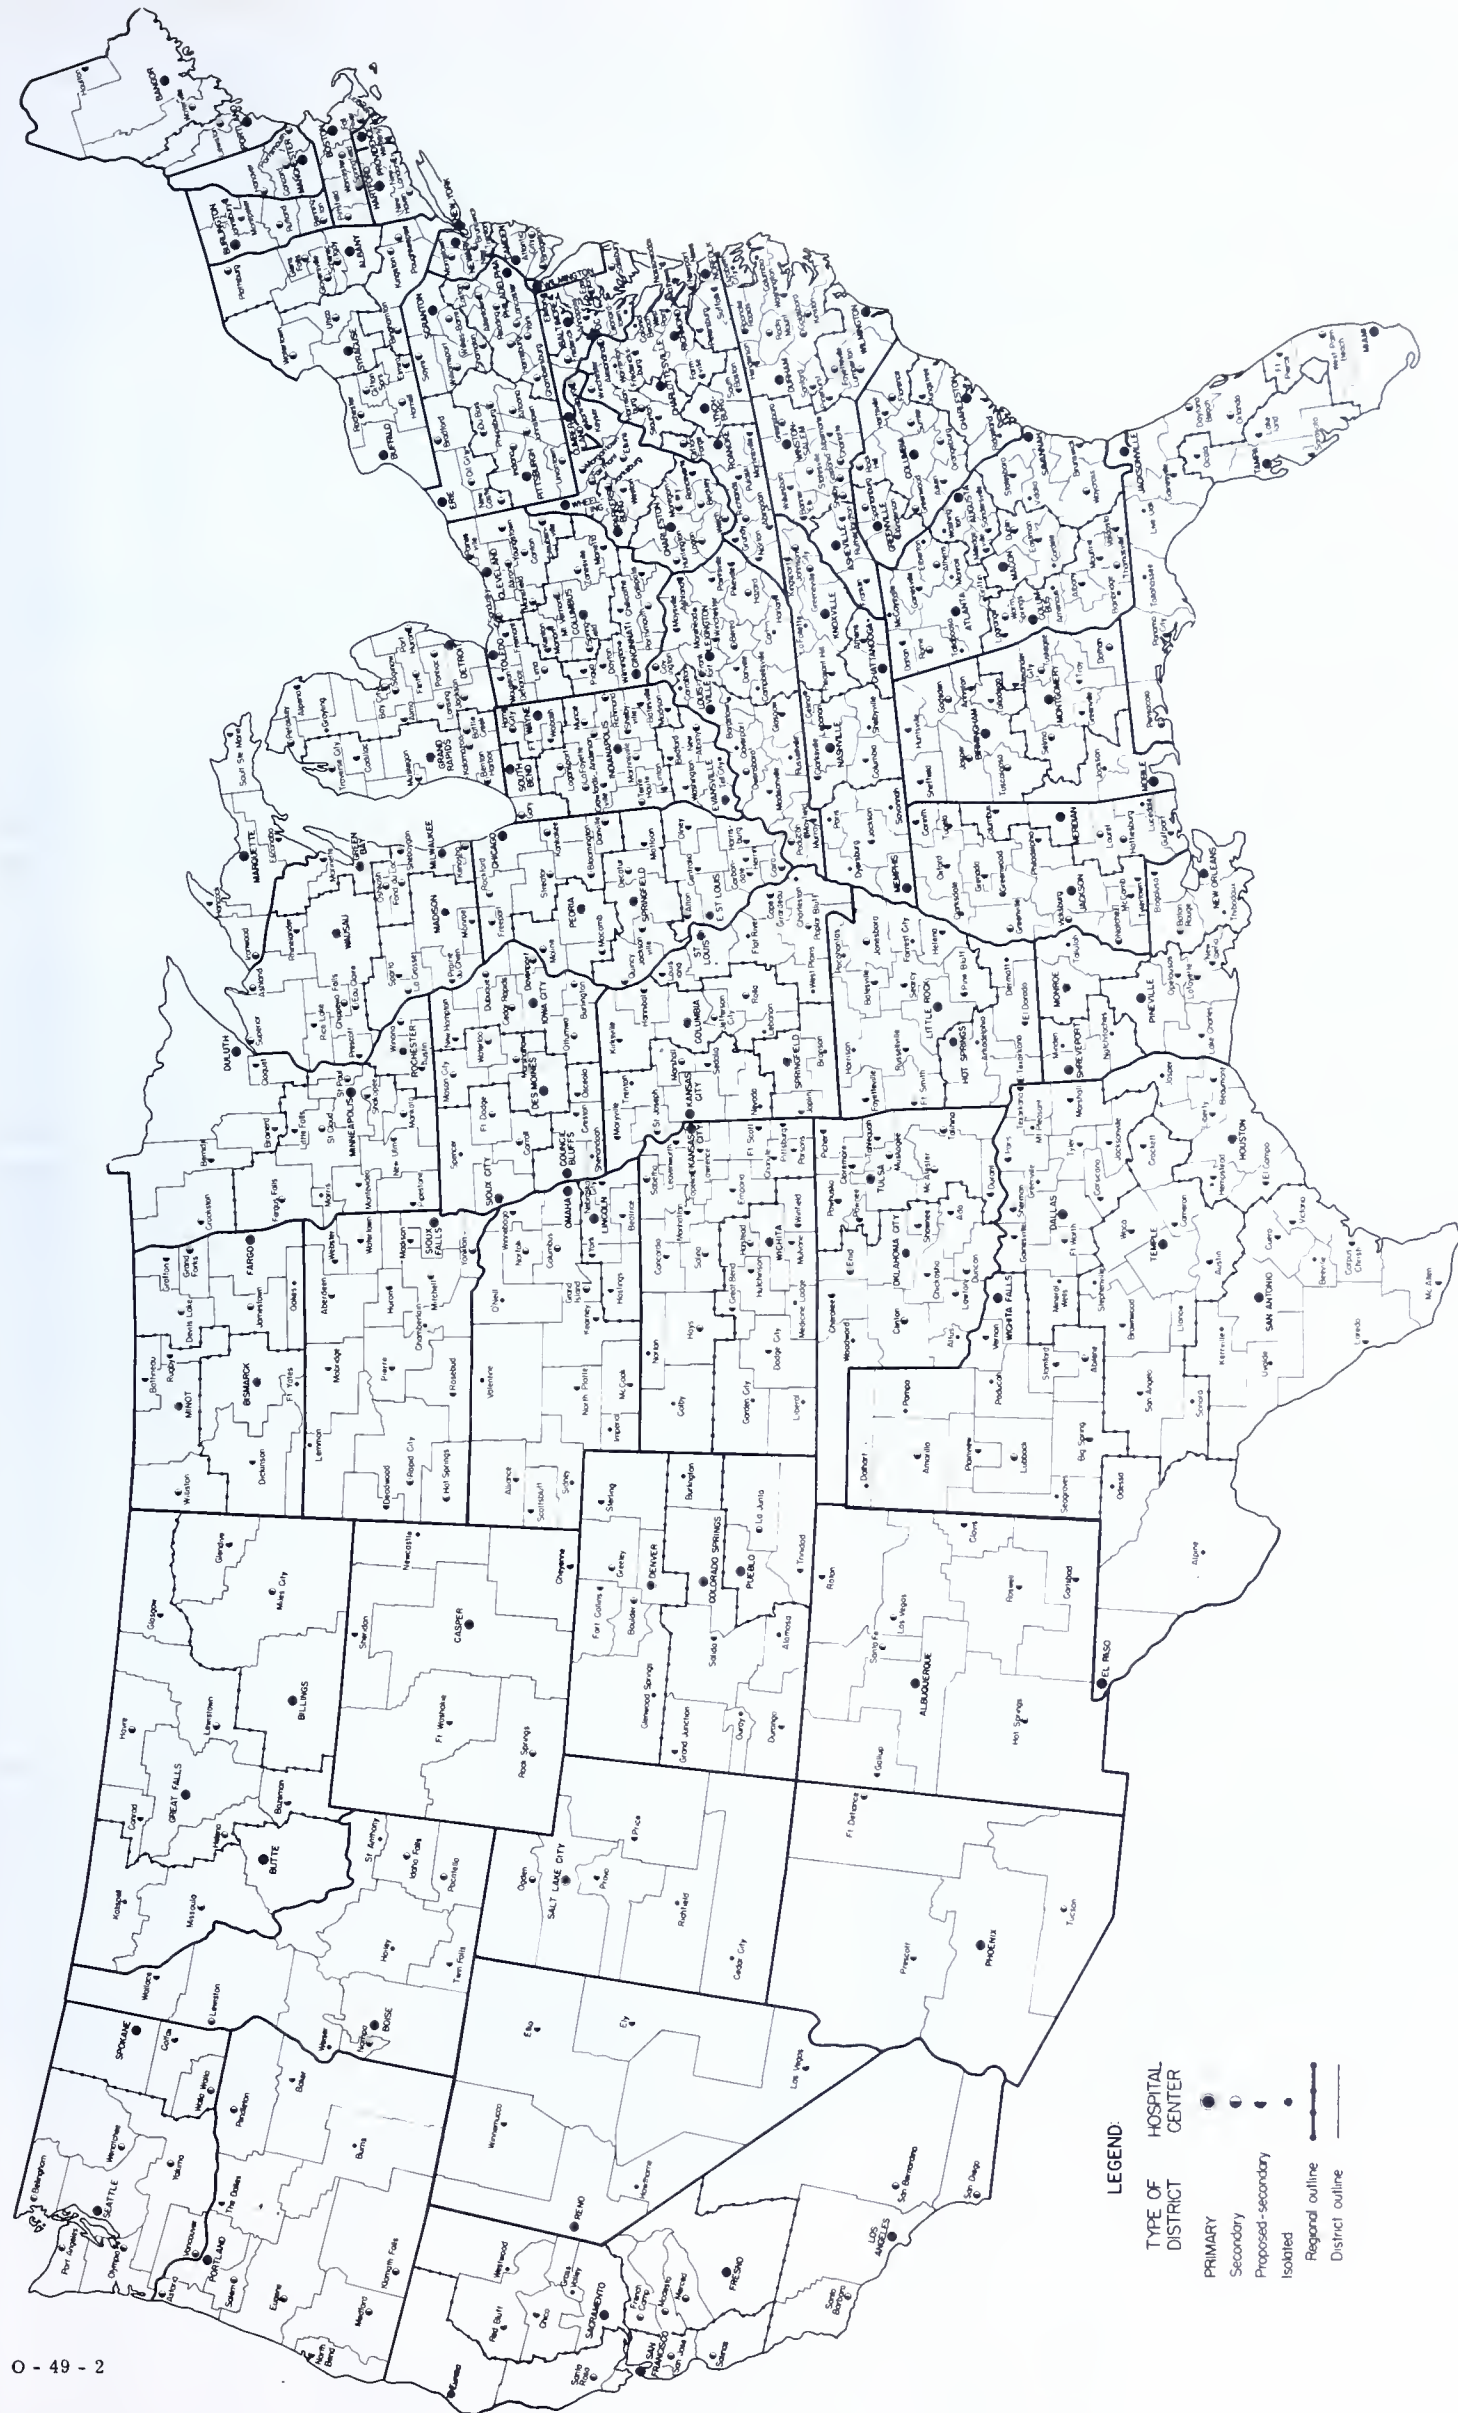

FIGURE 2.—Provisional districts composed of counties, making up broad health service regions within States, and the name and location of district and regional hospital centers, based upon the distribution of existing hospital facilities in the United States, 1942.

TABLE 2.—Population and number of active non-Federal physicians in health service districts grouped according to size of physician-population ratios, 1940

¹ Population totals were accumulated from county population figures published in: Population, First Series, U. S. Summary, table 17, Sixteenth Census of the United States, 1940.
² Active non-Federal physician counts for 1940 were obtained by tabulating data for individual physicians listed in the 1940 American Medical Directory. Physicians listed as retired or otherwise not in practice and those employed by a Federal agency were excluded from the totals.

retired or not in practice; about 7 percent of the physicians in the South Atlantic and Mountain States; and of those listed in the Pacific area, more than 11 percent were retired or not in practice. Although lower, the proportions of Federal physicians in the various geographic areas tended to parallel somewhat the proportion in the non-active category. The combined number of these two groups excluded from the total count represents about 6 percent of all physicians in the New England and Middle Atlantic and North Central areas, 8 percent in the South Central, 13 to 14 percent in the South Atlantic and Mountain States, and nearly 16 percent in the Pacific States.

It is believed that the adjusted total of 160,480 physicians (122 per 100,000 persons) approximates the number whose activities are concerned, for the most part, with rendering medical services directly to the civilian population.⁸ Of these 124,404 were general practitioners⁹ and 36,076 limited their practice to a specialty. Interns and residents were not identified in the data concerning active non-Federal physicians abstracted from the 1940 Directory. Information regarding opportunities for personnel in these categories, published annually in the Educational Number of the Journal of the American Medical Association, indicates that there were approximately 11,800 interns and residents in the several States in 1940. Since their assignment consists largely of caring for patients, the inclusion of interns and residents in the enumerations presented in this paper has seemed appropriate. The number of active

⁸ In the 1940 Directory, 9,873 physicians were listed as retired or not in practice and 4,793 had indicated that they were employed by Federal agencies.

Data at hand did not permit the exclusion of physicians serving in administrative, teaching, research, insurance, or industrial positions. The American Medical Association physician census in 1942 found about 6 percent of all physicians were in these groups (13).

⁹ Physicians whose listings in the 1940 Directory indicated special interest in, but who did not limit their practice to a designated branch of medicine, are included with the general practitioner count. As Leland (3) in a study on physician distribution so aptly pointed out: "It seems fair to assume that in many cases physicians who classified themselves as giving 'special attention' to a subject should be classified as general practitioners so far as their service to the community is concerned. Their statement to the Directory may indicate a situation varying all the way from a mere wish, interest, or intention to a real entrance into the field of specialization."

non-Federal physicians by type of practice in each county of the United States in 1940 is given in appendix table I. In the listing, counties are arranged by districts and regions within each State according to the hospital pattern just discussed.

An over-all picture of physician resources at the local level may be obtained from the map reproduced as figure 3. For this chart, the 760 tentative health service districts have been classified into five groups on the basis of active non-Federal physician-population ratios in 1940. Combined data for districts in each of the five categories designated on the map are presented in table 2 for comparison of average values. Those composing the topmost group averaged 185 physicians per 100,000 population in 1940, while for the lowest group the average was 61, less than one third the high ratio. The median age of physicians for the less-favored localities was 10 years greater than for those relatively well-supplied with physicians. Thus, areas with lower ratios of physicians to population have higher proportions of physicians in the older age categories and may expect proportionately more losses from deaths each year than those in the latter group. Districts that maintained the most favorable physician ratios also provided the greatest number of specialists. Within areas most generously supplied with physicians, 27 percent of all physicians were full-time specialists while in areas with the lowest resources only 12 percent of the total were specialists.

Districts maintaining 150 physicians or more per 100,000 population in 1940 represented more than one fourth (27 percent) of the population of the country as a whole, but the situation varied markedly from one geographic section of the country to another. Reference to figure 4 will show that 45 and 53 percent, respectively, of the populations in the New England and Middle Atlantic States and in the Pacific States resided in districts with the most favorable ratios. The proportion was only 26 percent or about the national average in the North Central States and was as low

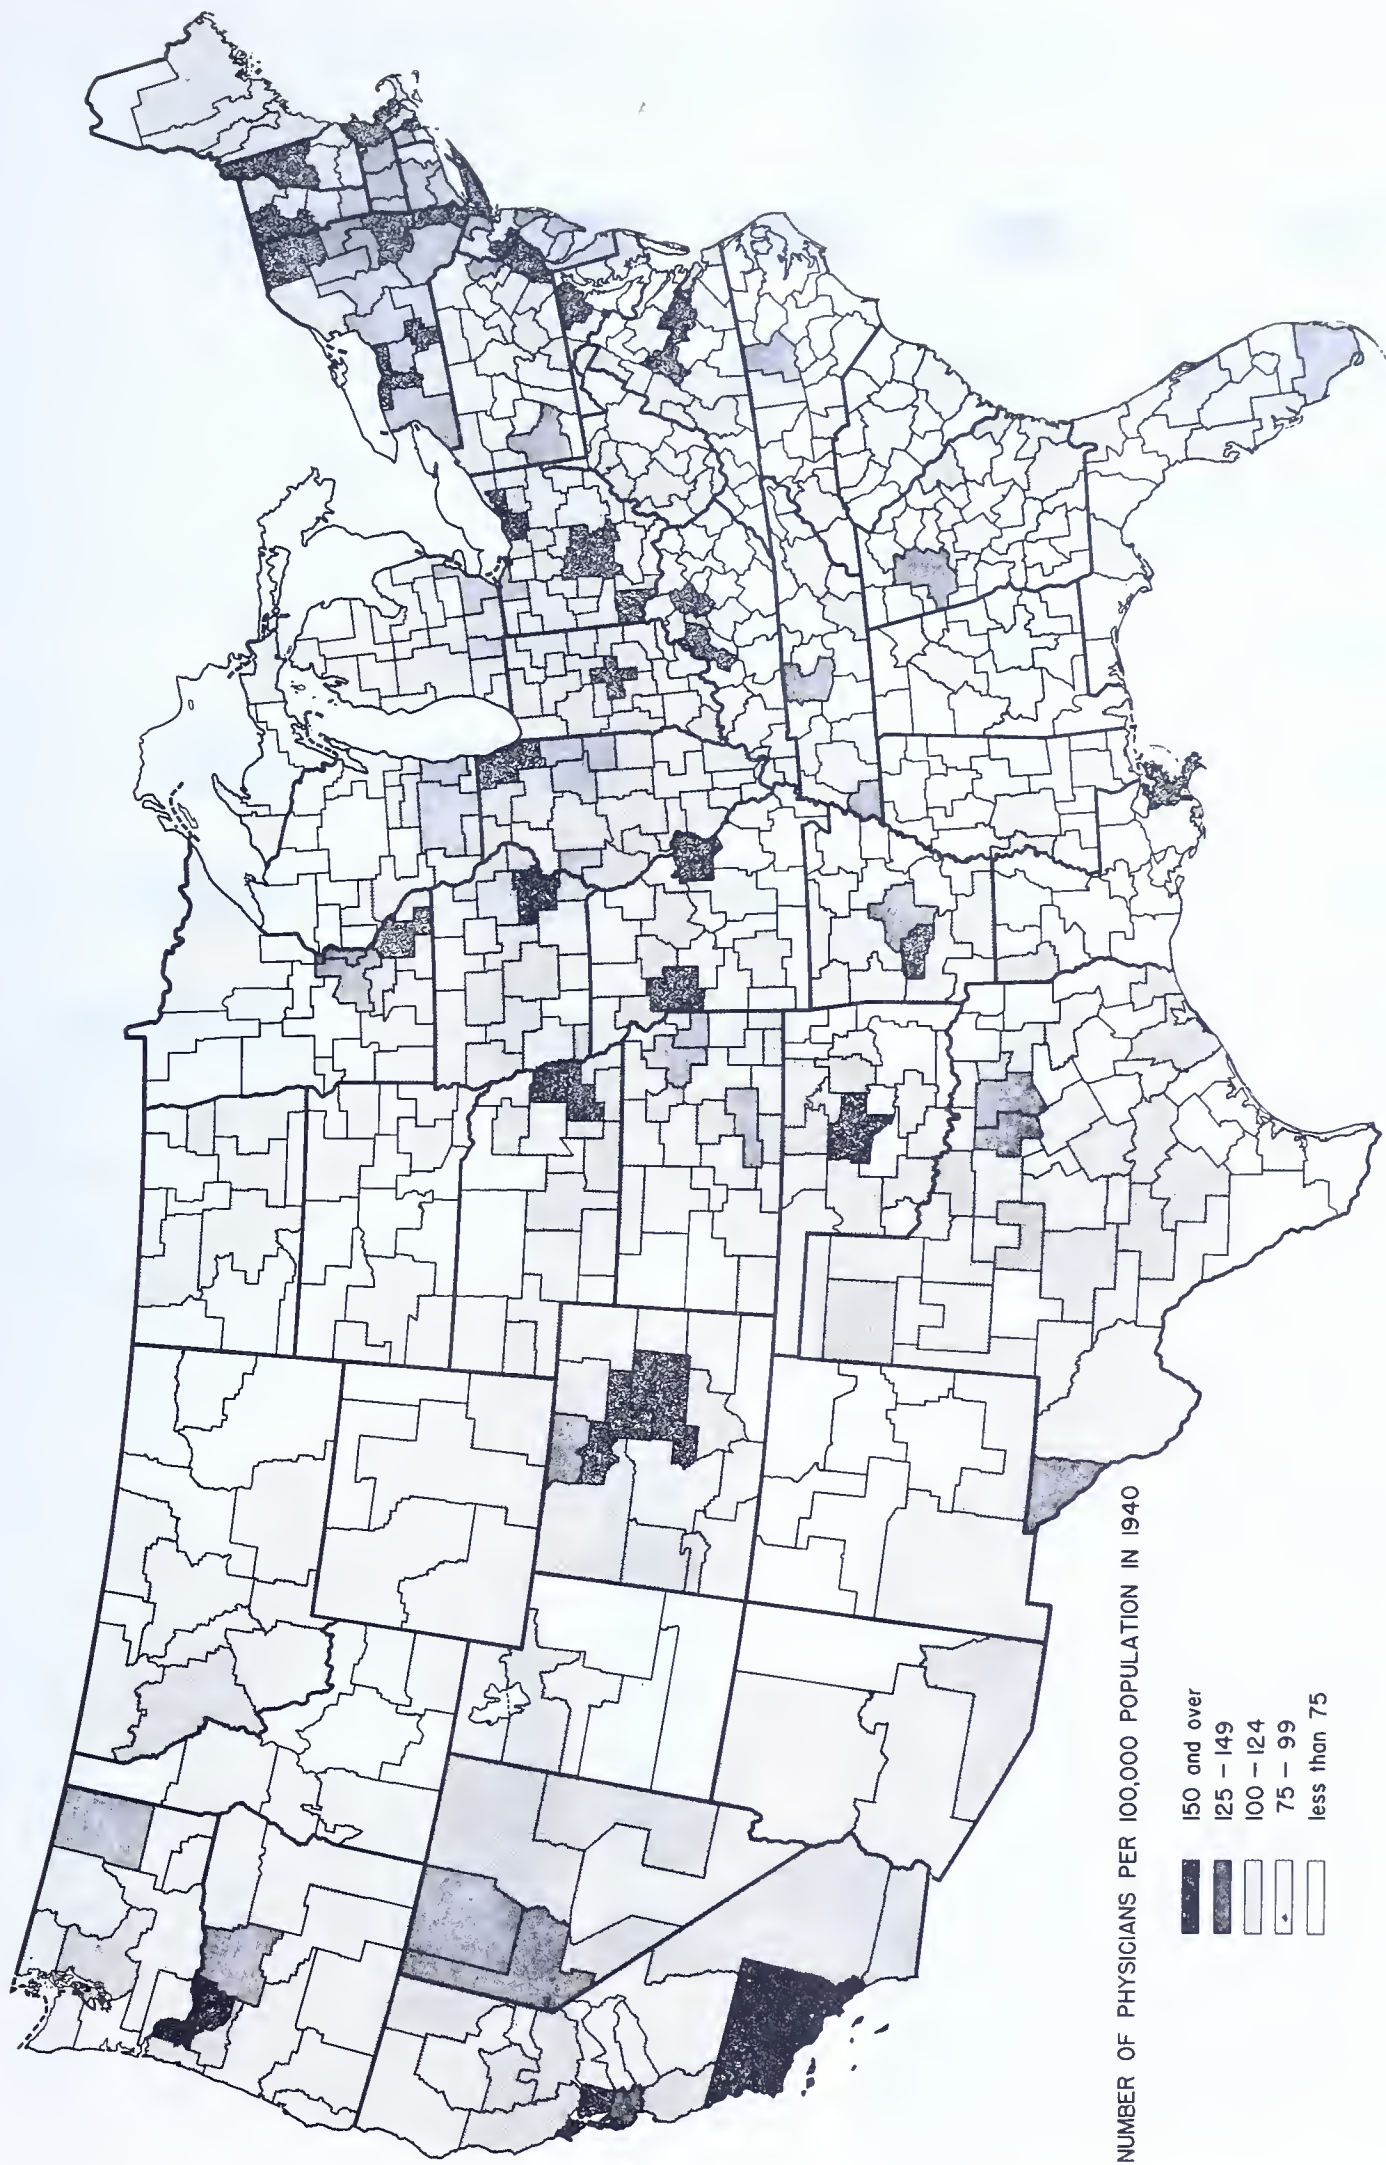

FIGURE 3.—Number of active non-Federal physicians per 100,000 population in tentative health service districts within each State, 1940.

FIGURE 4.—Percent of population in tentative health service districts grouped by size of active non-Federal physician-population ratios of districts for designated geographic areas of the United States, 1940.

as 13, 12, and 7 percent in the Mountain, South Atlantic, and South Central States, respectively. On the other hand, the proportion of persons living in districts characterized by low ratios followed an opposite pattern, varying from approximately 1 percent in the first two groups of States to 47 percent in the last group.

It will be recalled that the hospital service area patterns, which are being used as a basis for analyzing the distribution of physicians, consist of local districts grouped into regions roughly representing broad trade areas. Within such a region would generally be contained a primary district with a large well-developed hospital center which might serve to coordinate medical and health activities of suggested secondary, proposed-secondary, or isolated districts. For the five categories into which health service districts are grouped (see table 2), the number of residents in each of the four designated types of districts is expressed as a percent of the United States population in figure 5. Practically speaking, residents of primary areas, which alone account for about one half of the country's population total, form but a small percentage of the groups having less than 100 physicians per 100,000 population. They represent from almost one half to three fourths of the people in areas

FIGURE 5.—Percent of United States population contained in the four outlined types of districts grouped according to size of active non-Federal physician-population ratios of these districts, 1940.

with ratios from 100-149 and practically all in areas where the ratio exceeds 150. At the other extreme, proposed-secondary and isolated districts have not quite one fifth of

the national population total, yet their residents comprise appreciable fractions of the total group of persons residing in areas with ratios under 100.

Physician Resources in Hospital Service Regions in 1940

According to the hospital service pattern outlined, the 760 districts are grouped into 126 regions which are relatively extensive in area, some even being State-wide. The effects of such combinations are reflected in the map, figure 6. Obviously such grouping of districts will bring about averaging of the relatively generous number of medical personnel and facilities which characterize primary districts with less adequate provisions of secondary, proposed-

secondary, and isolated districts within each region. A comparison of data in table 3 with those in table 2 indicates that by combining districts into regions the fraction of the population classified as in areas with very high or with very low physician-population ratios is reduced while the fraction of those listed as in areas with intermediate ratios is increased. In addition, differences in the concentration of specialists are materially reduced.

TABLE 3.—Population and number of active non-Federal physicians in health service regions grouped according to size of physician-population ratios, 1940

| Less than 75 | 24 | 16, 527, 384 | 13 | 688, 641 | 11, 177 | 68 | 51. 0 | 2, 026 | 18 |

¹ Population totals were accumulated from county population figures published in: Population, First Series, U. S. Summary, table 17, Sixteenth Census of the United States, 1940.
² Active non-Federal physician counts for 1940 were obtained by tabulating data for individual physicians listed in the 1940 American Medical Directory. Physicians listed as retired or otherwise not in practice and those employed by a Federal agency were excluded from the totals.

Physician-Population Ratios As Measures of Adequacy

Evidence of such wide discrepancies in provisions for medical care in the various regions emphasizes the need for some yardstick to measure the extent to which physicians might be utilized in different communities. A review of recent literature reveals that opinions as to the number of physicians required to provide adequate medical care vary widely both within and without the medical profession. Many writers have discussed the subject generally (14), (15), (16), (17), (18), (19), (20), (21).

Others have actually presented selected physician ratios as standards of adequacy. Perhaps the most thorough of these is a study of requirements for general practitioners as well as specialists by Lee and Jones (22) which was published about 15 years ago as part of the work of the Committee on the Costs of Medical Care. Their report indicates that 142 physicians per 100,000 persons would be necessary to provide all persons with essential medical care. The 142 physicians would consist of 116 general prac-

tioners and 26 physicians engaged in the practice of the various medical specialties. Numerous studies initiated since that time have utilized the physician-population ratios which the Committee set up to estimate physician requirements.

Some writers have adopted ratios based upon professional opinion and judgment which are somewhat different from those prepared by Lee and Jones. In the 1945 Hospital Review published by the American Hospital Association (23), it was suggested that from 18 to 20 physicians, of whom 3 to 5 might be specialists, would be needed to serve 20,000 to 25,000 persons. It was assumed, however, that facilities in more fully developed hospital and medical centers would be available to provide the rare and highly developed specialty services. A plan for group practice outlined by the Clarks (24) would allow 25 physicians, 11 of whom might be either full or part-time specialists, for 20,000 persons. As the group increases in size, they

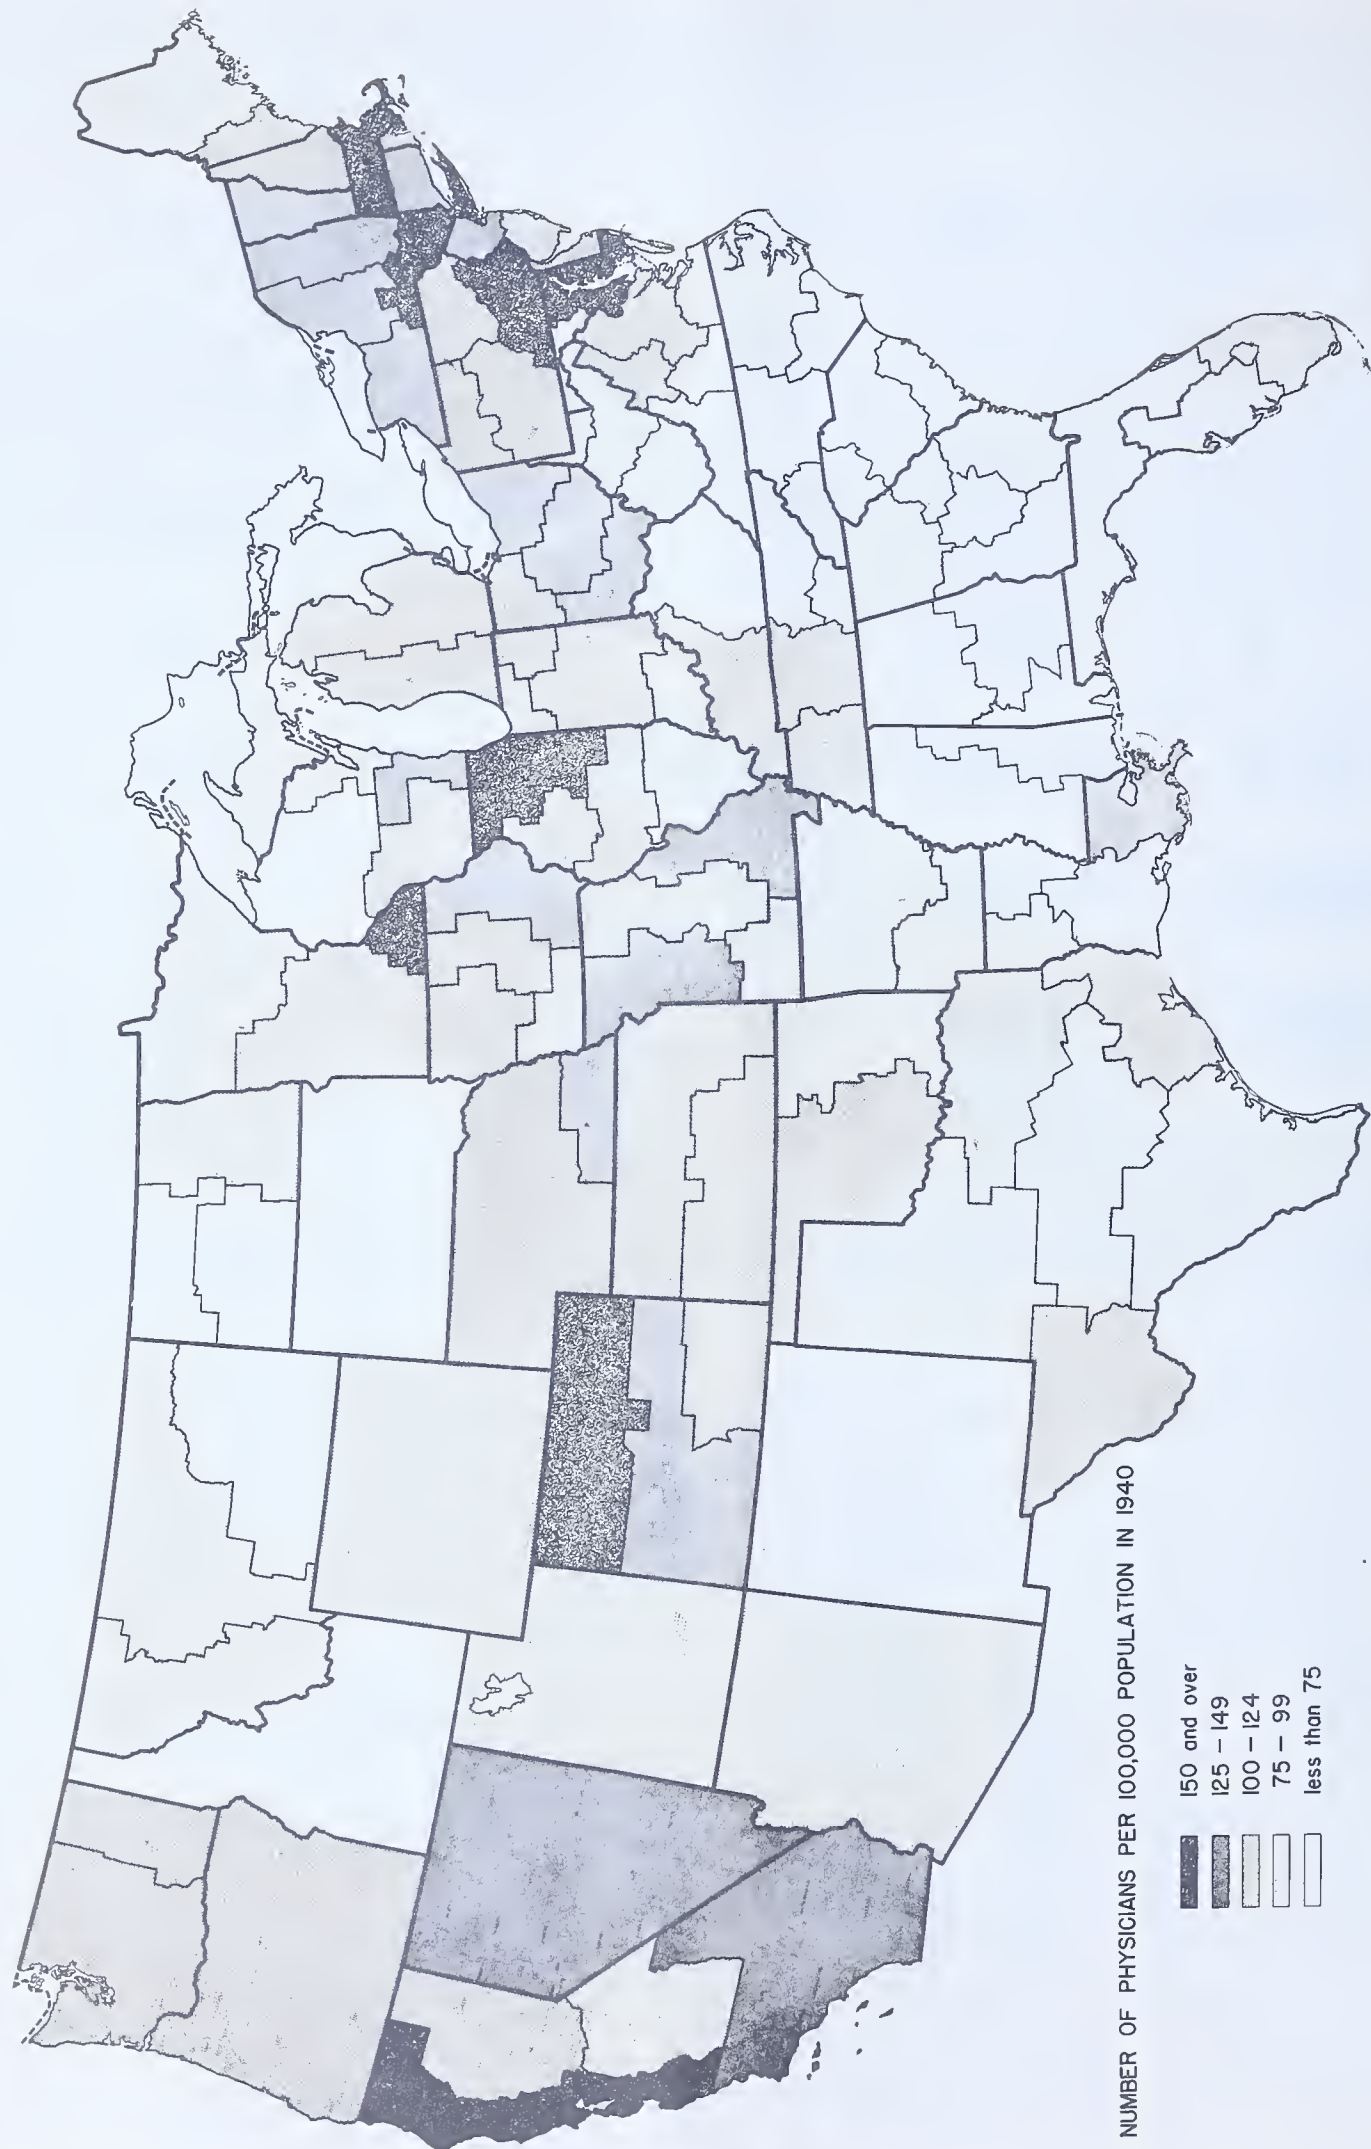

FIGURE 6.—Number of active non-Federal physicians per 100,000 population in tentative broad health service regions within each State, 1940.

anticipate that more of the specialists will be able to devote full time to the practice of their specialty, and consequently, a greater proportion of general physicians would be needed to take over routine medical duties. Pastore (25) in a report to the Committee on Future Plans of the New York Hospital and Cornell University Medical College pointed out that a group of 40,000 persons might need as many as 66 physicians; more than half of these would be engaged in some type of specialty service. He assumed, however, that the services of many specialists are too limited for a clientele of 40,000 persons so that possibly as many as half of the staff would be on a part-time specialty basis.

Because of wide differences in estimates of needs for physicians derived by various writers largely from theoretical considerations, the authors sought criteria based on actual experience which might serve as measures of adequacy. As a first step in obtaining figures reflecting actual utilization of physicians, the 126 provisional health service

regions were arrayed from high to low on the basis of active non-Federal physician-population ratios in 1940. Population data for these regions were then accumulated and physician totals prepared to indicate the number of physicians serving different sections of the population in 1940. It was found that one quarter of the inhabitants of the United States in 1940 were located in regions that maintained 146 or more physicians per 100,000 population; about one third were in regions that had 136 or more physicians per 100,000 population; and almost one half of the population of the United States in 1940 were located in regions in which ratios of 118 or more prevailed. Use of these three ratios as minimum measures of adequacy indicates that additional physicians numbering 41,947, 32,256, or 18,422 would have been needed in 1940 to have brought active non-Federal physician-population ratios in low supply areas up to 146, 136, or 118 per 100,000 population, respectively.

Estimates of Active Non-Federal Physician Utilization in 1960

If it may be assumed that equalizing opportunities for medical service at some selected level is desirable, estimates may be projected into future years and training programs set up that will implement the objectives. As a target year for preparing estimates and indicating possible location patterns of medical service, the year 1960 was selected. This allows time to effect, at least in part, some of the adjustments that may seem appropriate. Since physician projections are based on the population of service regions previously described, preparation of regional population estimates was necessary before physician figures for 1960 could be computed. Current population data are limited to State and national totals. No State figures are available for 1960 although a variety of national population estimates ranging from 150,000,000 to 162,000,000 have been published by the Bureau of the Census (26) on the basis of different assumptions of mortality, fertility, and immigration. Current high birth rates suggest that the higher forecasts of population will most closely approximate what may be expected in 1960.

In our preparation of regional estimates, we first approximated 1948 regional totals by allowing each tentative health service area the same proportion of the State population total in 1948 as it had in 1940. We then prepared 1960 estimates for States and regions by projection on the assumption that trends which characterized the 1930 to 1940 period in each area would prevail during the 12 years following 1948. The resulting total of 156,786,000 is being used as an estimate of the 1960 civilian population. This number was raised to 158,286,000 by the addition of 1,500,000 for the armed forces to reflect total population for the country.¹⁰ The over-all population estimate falls somewhat

above the midpoint between the high and low 1960 forecasts for the country released by the United States Bureau of the Census.

Estimates of the number of physicians that the civilian population might use, if available by 1960, were prepared as outlined below, using the three measures of adequacy previously described. For convenience in referring to these procedures, they have been designated as methods A, B, and C. In general, each method involves the application of one of the measures of adequacy to the estimated 1960 civilian population of each region. Areas, however, which in 1940 maintained more physicians relative to population than the selected standard are allowed the same physician ratio that they had in 1940. It was assumed that few, if any, of these areas would in actuality experience a loss.

For method A, the authors assumed that inhabitants of each broad health service region in the country might eventually use 146 physicians per 100,000 population, the minimum ratio among the 12 top regions which in 1940 contained a quarter of the Nation's population. Application of this ratio to the estimated 1960 civilian population of each of the 114 regions which had lower resources in 1940 leads to a 1960 physician requirement of 171,119 for the group. Physician estimates for the 12 regions with greater physician resources in 1940 were computed by allowing the 1960 estimated population of each of these regions their respective 1940 physician ratios. By accumulating the results of such calculations a total of 70,053 is obtained. Combination of these 2 estimates indicates an active non-Federal physician total of 241,172 for the country in 1960.

Estimates according to method B were prepared in a comparable manner. All regions in the country were allowed a physician ratio of 136, the minimum available in 1940 to the 16 regions containing the third of the Nation's

¹⁰The authorized armed strength for 1948 was used as an approximation of military personnel in 1960.

population best supplied with physicians. No region, however, was allowed a physician ratio lower than the one prevailing in that area in the base year. Such computations imply a physician total of 229,785, (140,352+89,433) for 1960. Finally, for method C it was assumed that the physician ratio of 118, the lowest one maintained among the top 37 regions containing half of the inhabitants of the United States might represent a minimum for the rest of the country. The result obtained from the application of this

ratio to the 1960 population estimates for regions with ratios below 118 in 1940 plus the estimate for the 37 regions based on 1940 ratios gives a total of 213,532, (90,822+122,710). In order to illustrate a pattern of physician distribution as well as to indicate the magnitude of such estimates locally, active non-Federal physician totals for 1960 derived from the use of these three methods are presented in appendix table II for the broad health service regions outlined within each State.

Active Non-Federal Specialist Estimates for 1960

In a previous section, it has been pointed out that in 1940 the number of specialists in relation to all physicians varied from region to region. In general, regions with more generous physician resources maintained somewhat greater concentrations of specialists. In seeking some measure to be used in preparing specialist estimates for 1960, the authors investigated data for 1940 which would reflect use of such medical personnel in groups of regions not affected by extremes in physician resources. Within regions which contained the middle half of the United States population in the array based on active non-Federal physician ratios, 22 percent of the physicians limited their practice to a specialty. Corresponding percentages for the designated types of specialty practice are shown below:

| | |
|--|------|
| All specialists..... | 22.0 |
| Ophthalmologists and otorhinolaryngologists..... | 4.8 |
| Surgeons..... | 4.1 |
| Internists..... | 3.8 |
| Obstetricians and gynecologists..... | 1.4 |
| Pediatricians..... | 1.4 |
| Psychiatrists and neurologists..... | 1.2 |
| Urologists..... | 1.0 |
| Radiologists and roentgenologists..... | 1.0 |
| Orthopedists..... | .7 |
| Dermatologists and syphilologists..... | .6 |
| Pathologists and bacteriologists..... | .6 |
| Anesthesiologists..... | .2 |
| Tuberculosis specialists..... | .4 |
| Public health specialists..... | .8 |

These percentages were adopted as measures of specialist use in preparing 1960 estimates of such personnel for methods A, B, and C. To estimate specialists for method A, regions with rank numbers 1 to 12 in the array (as in the case of all physicians) were allowed in 1960, proportionately, as many physicians in the several types of practice as prevailed in these areas in 1940. (See appendix table I for the specialist distribution of a given region in 1940.) Within all other regions, however, it was assumed that 22 percent of the 1960 active non-Federal physician total would be specialists. The distribution of these specialist totals by type of practice was determined by applying the above set of percentages to the 1960 physician estimates of regions 13 to 126. In all, 55,185 specialists (17,539+37,646) were estimated for the United States in 1960 for

this method. The number of physicians in each type of practice that might be used in the United States by 1960 are summarized in table 4.

TABLE 4.—Number of active non-Federal physicians engaged in different types of practice in 1940 and corresponding estimates of such physicians for the civilian population in 1960

| Physician designation | Active non-Federal physicians | | | |
|--|-------------------------------|--|---------|---------|
| | 1940 total ¹ | Estimates for 1960 according to method | | |
| | | A | B | C |
| Total..... | 160,480 | 241,172 | 229,785 | 213,532 |
| General practitioners..... | 124,404 | 185,987 | 176,538 | 163,686 |
| Specialists..... | 36,076 | 55,185 | 53,247 | 49,846 |
| Ophthalmologists and otorhinolaryngologists..... | 7,508 | 11,486 | 10,973 | 10,180 |
| Surgeons..... | 6,512 | 9,975 | 9,495 | 8,911 |
| Internists..... | 6,337 | 9,848 | 9,564 | 9,045 |
| Obstetricians and gynecologists..... | 2,544 | 3,884 | 3,843 | 3,614 |
| Pediatricians..... | 2,407 | 3,611 | 3,532 | 3,316 |
| Psychiatrists and neurologists..... | 2,224 | 3,445 | 3,353 | 3,170 |
| Urologists..... | 1,695 | 2,495 | 2,412 | 2,270 |

| Pathologists and bacteriologists..... | 949 | 1,522 | 1,476 | 1,377 |
| Anesthesiologists..... | 284 | 516 | 522 | 490 |
| Tuberculosis specialists..... | 601 | 927 | 916 | 825 |
| Public health specialists..... | 1,435 | 1,713 | 1,570 | 1,457 |

¹ Active non-Federal physician counts for 1940 were obtained by tabulating data for individual physicians listed in the 1940 American Medical Directory. Physicians listed as retired or otherwise not in practice and those employed by a Federal agency were excluded from the totals. Only those physicians who indicated that their practice was limited to a particular branch of medicine are classified as specialists. All other physicians were included in the general practitioner total.

A similar procedure was followed in preparing specialist estimates for the other two cases. For the B method, the top 16 regions of the array and for the C method, the top 37 regions, were allowed proportions of specialists in each type of practice in relation to all physicians that characterized the 1940 count. Specialist estimates by type of practice for "all other regions," in both instances, were obtained by distributing the 1960 active non-Federal physician estimate of that group according to the same percentages applied to the "all other region" category for method A. Such calculations lead to a specialist total for method B of 53,247,

(22,370+30,877) and for method C for 49,846, (29,865+19,981). As for method A, physician estimates by type of practice for the United States are summarized in table 4. In each case, the difference between the 1960 active non-Federal physician total and the specialist total is designated as the general practitioner estimate. Regional estimates for specialists and general practitioners corresponding to the totals for active non-Federal physicians which appear in appendix table II may readily be obtained by following the estimation procedures described above.

In order to prepare more localized estimates, it would be necessary to adjust the proportions of general practitioners and specialists used for the region level. Specialists, particularly, will concentrate in large hospital centers whereas general practitioners, some of whom may have limited competence within a specialty, will provide the bulk of the serv-

ice available locally in less urban areas. If it may be assumed that future hospital development would be based on a pattern similar to the one described in general terms earlier in this bulletin, then possibly specialist location within a broad region might be determined in terms of the underlying factors of such a hospital coordination scheme. The hospital center of the primary district within a broad service region of a State would be expected to supply the extra facilities and personnel necessary to provide people of the subsidiary areas with special medical and surgical services beyond the resources of peripheral institutions. Consequently, under such an arrangement all types of specialty practice would be represented in primary hospital centers, whereas subsidiary hospital centers of a region would have only the types of specialists compatible with actual need and extent of hospital facilities.

Total Number of Physicians for 1960—Estimates Based on Use

The physician estimates discussed in the previous section are active totals prepared for the civilian population only. In addition to these, provision must be made for general physicians and specialists employed by Federal Government agencies such as National Defense, Veterans Administration, and the Public Health Service. Also some account would have to be taken of non-Federal and Federal physicians who in 1960 would be retired or not engaged in active practice. Present indications point to the fact that 20,000

physicians¹¹ will be required for Federal agencies. Furthermore, it is expected that as many as 11,000 physicians,¹² non-Federal and Federal, will be retired or otherwise not in practice. The over-all total for the United States would, therefore, need to be expanded to 272,172 physicians (241,172+20,000+11,000) if the first method of estimation is used; 260,785 physicians (229,785+20,000+11,000) if the second procedure is employed; and 244,532 physicians (213,532+20,000+11,000) if the third approach is considered.

Physician Counts in the Territories

Estimates of the number of physicians that might be used in Alaska, Hawaii, Puerto Rico, and the Virgin Islands have not been prepared for presentation in this report. Physician and population totals for the Territories in 1940 were as follows:

| Territory | Population | Total physicians | |
|--------------------------|------------|------------------|------------------------|
| | | Number | Per 100,000 population |
| Alaska | 72,524 | 74 | 102 |
| Hawaii | 423,330 | 455 | 107 |
| Puerto Rico | 1,869,255 | 473 | 25 |
| Virgin Islands | 24,889 | 14 | 56 |

It is evident that the number of physicians available for a given unit of population in each of the several Territories was much less than the ratio of 133 per 100,000 population (see table 1) which characterized the 48 States and the District of Columbia in 1940. For the most part, these

physicians are graduates of medical schools in the continental United States. It seems likely, therefore, that recruitment to replace losses from the profession and to bring about any needed increase will be drawn from graduates of these same schools.

Careful study of special problems in each area would have to be made to determine future needs. Therefore it has not seemed appropriate to estimate physicians likely to be used in the Territories in terms of criteria employed for the States. Any estimates of additional physicians needed for such areas would have to be added to the total number of new physicians estimated for the continental United States by 1960 unless medical schools are established in the Territories.

¹¹ It has not been possible to obtain official estimates of 1960 peace-time physician requirements for the several Federal agencies. However, on the basis of such information as could be obtained, 20,000 seemed to be a reasonable figure to use in building up estimates of total physician requirements.

¹² This figure represents the difference between the total physician forecast for 1960 and the estimated number of active physicians at that time. The latter total was approximated by using formula 5 in appendix B of an article by Pennell (27) on methods for estimating physician resources.

Some insight into the possibility that physician totals may reach levels commensurate with estimates of use in 1960 can be obtained from a projection based on present trends. The physician group in 1960 will be composed of survivors from the physicians listed in the 1940 Directory, from physicians who entered the profession between 1940 and the present, and from new physicians who will be added in the ensuing 11 years. From among the first category mentioned, the 175,146 physicians, only 97,338¹³ are likely to survive until 1960.

Precise counts of physicians who entered the ranks of the profession from 1940 to the present are not available. During the period from 1940 to 1948, some 53,995 students (28) were graduated from approved medical schools in the United States.¹⁴ In addition, approximately 8,497 graduates¹⁵ from medical training facilities other than approved schools in the United States were licensed to practice medicine on the basis of State examinations between 1940 and 1948. Presumably, most of these represent further additions to the profession. It is thus evident that a total of about 62,452 physicians has accrued since 1940. Adjustment for expected losses indicates that approximately 57,763 will survive to 1960.

An approximation of new physicians who may be added in the 11-year interval between 1948 and 1960 has been built up as a composite of several subestimates. Enrollments in recognized medical schools for the first, second, and third year classes of the 1947-48 session (the latest year for which enrollment figures by classes are available) suggest a total of about 16,487 graduates for 1949, 1950, and 1951 combined. The assumption that output each year from these same schools will continue at the anticipated 1951 level of 5,800 implies 46,400 graduates for the following 8 years. New medical schools recently proposed (29), if established, may train some 3,000 additional physicians. Accumulation of these totals indicates that 65,887 medical students may be graduated from approved schools in the United States by 1960. If it is assumed that approximately 700¹⁶ individuals from all other sources would be licensed annually, then the estimated count of new physicians would

be increased by 7,700 recruits to 73,587. Anticipated losses would reduce this figure to about 72,018 survivors in 1960.

Addition of survivors from the three sources referred to, namely, 1940 physicians, individuals who have entered the profession since that date, and estimated new recruits who may enter the profession during the 11 years following 1948 leads to a total of some 227,119 physicians (97,338 + 57,763 + 72,018) by 1960 as contrasted with corresponding numbers of 175,146 in 1940 and 199,755 in 1948. This forecast for 1960 assumes a survival pattern equivalent to that reflected by the 1930 to 1939 mortality experience for white males. Somewhat more favorable mortality rates have characterized the years from 1939 to 1941, and the use of such rates would expand the forecast by a little over 1 percent. Abridged life tables recently released for 1945 suggest even further gain in life expectancy, but survival tables are not available in sufficient detail to permit calculation of the extent of this increase.

If the several estimates made regarding possible new entrants to the profession between 1948 and 1960 materialize, the over-all physician ratio will reach 143 per 100,000 population in 1960 as compared with 133 in 1940 and 137 in 1948. (See table 1.) Projections of possible physician use in 1960 ranging from 244,532 to 272,172 imply ratios ranging from 154 to 172 physicians per 100,000 population. Continued expansion in physician totals, equivalent to that which is anticipated in the period from 1948 to 1960, would be required for some two decades beyond 1960 to attain even the lower ratio.

Comparison of the foregoing estimates of possible physician utilization with a forecast of physician resources in 1960 provides several measures of the deficit which may be expected. The first procedure for estimating physician use in 1960—using 146 physicians per 100,000 population as a minimum measure of adequacy and making appropriate adjustments for Federal and retired physicians—would lead to a total of 272,172. The physician forecast for 1960 of 227,119 falls about 45,053 short of that goal. A similar projection based on a ratio of 136 for the civilian population indicates a total of about 260,785 physicians. This estimate would mean a deficit of 33,666. The third method followed in estimating physician use—applying a ratio of 118 to the civilian population in areas with low physician resources—would result in a total of 244,532 physicians. The deficit in this case would be 17,413.

If recruitment of larger numbers of physicians by 1960 were desirable, such efforts would necessarily be limited to the 7 years prior to 1960. Obviously, there is no way to increase the number of graduates from approved schools (the major source of physicians) before 1953 since the class from which 1952 graduates will be drawn has already completed its first year of medical training. Any attempt to meet these estimated deficits in 7 years would imply from 17,413 to 45,053 additions to the ranks of the medical profession above the 47,647 new physicians expected between

¹³ Survivors were estimated by adjusting 1940 physician totals on the basis of the 1930-39 mortality experience for white males according to the procedure outlined by Pennell (27) in an article on methods for estimating physician resources. Use of similar life tables based upon more current experience would have resulted in some slight increase in the estimated number of survivors in 1960. Average mortality rates for the 1939-41 interval would indicate a gain of about 1.8 percent in the total. Abridged life tables recently published for 1945 suggest a somewhat greater increase.

¹⁴ Students graduated in 1940 were included in this total since these physicians were not listed in the 1940 Directory.

¹⁵ Data published annually in the State Board Number of the Journal of the American Medical Association indicate that over the period from 1940 to 1948 approximately 944 graduates of unapproved medical schools in the United States, osteopathic schools, Canadian, and other foreign medical schools were licensed each year on the basis of examination while about 266 were licensed on the basis of reciprocity and endorsement. In projecting figures it has been assumed that the former group for the most part represent new additions to the medical profession in the year they were licensed. The latter group presumably were considered additions when first licensed to practice as "licensure by reciprocity" merely means relicensing in another State.

¹⁶ During the last few years about 700 physicians per year, from sources other than approved medical schools in the United States, were licensed to practice medicine through examination.

1953 and 1960. In fact, even if another decade were allowed to take care of expected deficits, present medical

training facilities would still have to be expanded considerably.

Total Specialists—Estimates of Requirements and a Forecast of Resources in 1960

The outlook regarding the availability of specialists would appear to be quite different from that for total physicians. There were 36,880 who limited their practice to a specialty in 1940; 804 of whom were in Federal service. To project the total number of specialists that might be used in 1960, an allowance of 3,355 for Federal agencies was added to each of the civilian population goals (see table 4) raising these figures to 58,540, 56,602, and 53,201, respectively. The estimate of 3,355 was approximated by assuming that proportionately as many of the 20,000 physicians who might be in Federal service by 1960 would be in each designated specialist category as characterized the 1940 Federal physician count of 4,793. Such levels, however, are not beyond reasonable expectancy if previous trends continue. There was a net increase of 10,124 specialists from 1934 to 1940 or an average of 1,688 per year. Assuming this trend continues throughout the period, then 33,760 new specialists will have been added to the 36,880 and thus, 70,640 specialists might be expected by 1960. In all but one category, tuberculosis, specialist numbers in 1960 may actually be in excess of the several estimates obtained for that year by employing the methods outlined earlier in the bulletin. (See table 5.)

TABLE 5.—Total number of specialists in 1940, estimates of the number whose services might be used by 1960, and specialist forecasts for 1960, by type of practice

| Specialist designation | Total specialists | | | | |

¹ Totals for specialists in 1940 include non-Federal specialists (see table 4) and those employed by the various Federal agencies.

² The specialist objectives for 1960 are, in each case, the sum of the estimates for the civilian population (see table 4) and the estimate for Federal agencies.

³ Forecasts for 1960, in this instance, were based upon the average annual increase in specialist totals which characterized the United States during the period 1934-40.

Summary

The authors extended the use of health service area patterns, originally formulated while studying needs in the general hospital field, to the study of physician requirements. In attempting to arrive at some means of gauging civilian use of physicians in the future, the authors investigated the actual experience of certain portions of the population in the base year, 1940. One quarter of the inhabitants of the United States were located in regions which had 146 or more physicians per 100,000 population in 1940; one third of the population were located in regions in which physician ratios of 136 or more prevailed; and a group of regions which contained half of the population of the United States maintained physician ratios of 118 or more. Estimates of the number of physicians that might be used in 1960 were prepared by allowing each region, in turn, the minimum physician ratio available to the three designated segments of the population but in no instance lowering the physician ratio of a region that had a higher ratio in 1940. Such computations resulted in 1960 active non-Federal physician estimates of 241,172, 229,785, and 213,532, respectively. In order to illustrate a pattern of physician location, three series of estimates corresponding to these

totals were prepared for the several tentative health service regions in each State. (See appendix table II).

To obtain over-all estimates for the United States, each of the three active non-Federal physician estimates was adjusted upwards to allow for physician needs in the various Federal agencies and to take account of those who would be retired or not in practice by 1960. The resulting totals of physicians who might be used if available by 1960 are 272,172, 260,785, and 244,532, respectively. These estimates of possible physician utilization in 1960 were then compared with anticipated physician resources by that time. Indications, at present, are that graduates from existing recognized medical training facilities in the United States plus recruits from other sources will result in at most 227,119 physicians by 1960, an increase of some 27,364 above the 199,755 in 1948. Thus, it is apparent that estimates of future physician use are far in excess of anticipated resources in 1960.

While current trends indicate a 1960 physician count considerably below the various over-all physician estimates for that year, the 1960 forecast for specialists is about 70,640 as contrasted with estimates of possible specialist use of 58,540, 56,602, and 53,201.

1/ Active non-Federal physician counts for 1940 were obtained by tabulating data for individual physicians listed in the 1940 American Medical Directory. Physicians listed as retired or otherwise not in practice and those employed by a Federal agency were excluded from the totals.

2/ All physicians other than those who indicated that they limited their practice to a particular branch of medicine are included within the general practitioners category.

3/ Only those physicians who indicated that their practice was limited to a particular branch of medicine are classified as full-time specialists.

4/ Yellowstone National Park is located within the limits of Idaho, Montana, and Wyoming.

5/ Baltimore City and Baltimore County are treated as a single political unit.

6/ St. Louis City and St. Louis County are treated as a single political unit.

7/ The five counties of New York City are treated as a single political unit.

8/ Each of the 24 independent cities of Virginia has been combined with an adjacent county, and each of the resulting groupings is treated as a single political unit.

Table II.—Population and number of active non-Federal physicians in 1940, and estimates of possible physician use in 1960, for the several health service regions outlined in each State

^{1/} Number in parenthesis opposite region designation indicates position in the array when regions are listed from high to low on the basis of active non-Federal physician-population ratios in 1940.

^{2/} Population totals were accumulated from county population figures published in: Population, First Series, U. S. Summary, Table 17, Sixteenth Census of the United States, 1940.

^{3/} Active non-Federal physician counts for 1940 were obtained by tabulating data for individual physicians listed in the 1940 American Medical Directory. Physicians listed as retired or otherwise not in practice and those employed by a Federal agency were excluded from the totals.

^{4/} Active non-Federal physician estimates for 1960 were prepared as follows:

Method A

Regions with rank numbers 1 to 12 in array were allowed the same active non-Federal physician-population ratios, respectively, as maintained in 1940. Regions with rank numbers 13 to 126 were allowed 146 physicians per 100,000 population.

Method B

Regions with rank numbers 1 to 16 in array were allowed the same active non-Federal physician-population ratios, respectively, as maintained in 1940. Regions with rank numbers 17 to 126 were allowed 136 physicians per 100,000 population.

Method C

Regions with rank numbers 1 to 37 in array were allowed the same active non-Federal physician-population ratios, respectively, as maintained in 1940. Regions with rank numbers 38 to 126 were allowed 118 physicians per 100,000 population.

^{5/} These figures represent 1960 estimates for the civilian population only. Over-all totals for the United States should include allowances of 20,000 physicians for Federal agencies and 11,000 physicians to balance those who are expected to be in "the retired and not in practice" category. Such additions would expand the 1960 figures resulting from the application of methods A, B, and C to 272,172, 260,785, and 244,532 physicians, respectively.
